Definition of Done

In our team we have decided to work with a set of two different definitions of done. One for the user stories and one for the increments. The definitions are defined as follows:

Definition of Done - User stories

For a user story to be considered done every task that stems from it must have successfully gone through each of the following phases:

1. *Implementation:* Properly implement the task according to its and/or its user story's specification.

2. *Testing:* Perform specification- and integration testing on the task.

3. *Peer reviewed:* Have at least one other person from the team quickly review the implementation to see that it fulfills its specification and works properly.

Once all of the tasks from a single user story have gone through all of these phases that user story will then be merged to the working branch of the current sprint after which it will be considered done.

Definition of Done - Sprints

For a sprint to be considered done all of the user stories chosen for the sprint must be done, the team must hold a retrospective to showcase the progress of the product and the team must also hold a sprint review where the team evaluates their work as a team and as individuals during the sprint. After all this the sprint is considered done after that product has officially been incremented with the work from the sprint.
